All communications should be addressed to the proper departments.

Subscriptions: $2.00 per year in advance. Special rates to members of the Union and in bulk and size.

FRIDAY MARCH 10, 1911

AEROPLANE CONSTRUCTION
STIMULATES PRODUCTION OF DURALUMIN

New Alloy Of Steel And Aluminum
Tennis Strength Of 4000 lbs.
Per Square Inch.

Simplicity and strengthening of the structure of an aeroplane by the use of duralumin, an alloy of steel and aluminum developed by the well-known firm of Vickers' Sons and Maxim, in England. This new metal possesses a tensile strength comparable with that of mild steel, as high as 20 tons per square inch, and a weight only slightly greater than aluminum, in 19 of composition aluminum makes up 50 or more, and by varying the proportions of the ingredients the desired physical properties may be obtained. It is practically free from any commercial use for which the lightness of aluminum with great strength are required, but in aeroplane construction and cars of dirigible balloons these qualities make it doubly useful. For aeroplanes especially, it will be commended by its lightness, durability under vibration and the fact that its non-magnetic properties will remove much of the difficulty at present experienced in navigating by compass.

COLLEGE NEWS

Alfred Cook, formerly professor of English in the University of California, now professor of English at Yale, gave $1,000 as an endowment for an essay prize in poetry for some student in the University of California.

LATEST IDEAS IN UMBRELLAS

First Seen in Boston at Hovey's---"The India"

The New "Little Umbrella With the Big Spread"

This is the umbrella which has aroused enthusiastic interest wherever shown.

A small umbrella having ten ribs (the ordinary one having but 7 or 8), under the customary air pressure, will thus provide a greater spread than the ordinary kind and the ladies will not break their feathers. Better protection from the rain and a great lessening of bulk and size.

Men's Size Umbrellas $2.50
