BISHOP N. S. THOMAS
TO SPEAK FOR T. C. A.
Missionsary Bishop of Wyoming Will Speak in Union Monday.

Bishop N. S. Thomas, of Wyoming who speaks in the Union Monday, at 1:30 P. M., at the regular meeting of the T. C. A., is just as enthusiastic about boosting his State as is seeking to interest Hobsons and Boasians in the work of his church. He knows his state; he has traveled all over it, on business, on his own, by automobile and on foot, and he knows its possibilities. Hence his address should be of interest to Technology men, especially to mining engineering students, for Wyoming is a mining country, and much of Dr. Thomas' work there has been in mining.

Although Bishop Thomas is in the last primarily in the interests of his church, he is going to put aside his personal purpose on Monday and tell some of his interesting experiences as "Missionary Bishop" of the great State of Wyoming. Bishop Thomas has broken the world treading the path he broke the world out into the Infinite. To us who are trying to look at the matter a little more rationally, this is all over, and that the heat of religious controversy is all over with us, and that the day of great organized religious movement is over. Nearly a month has passed since the Delta Epsilon contest. This contest was much talked about by all the students of the School, especially to mining engineering students, for Wyoming is a mining country, and much of Dr. Thomas' work there has been in mining.

We know that the founding of the Institute was the life-work of President Rogers; we know that he threw into it all the energy and ability at his command, and we know that today this little school which he found has become the greatest school of industrial science which the world has ever seen. He is a leader; in scientific thought and enterprise, a pioneer in the advance of education for which she is famous. Technology stands as an institution which, since the days of the most ancient civilizations, has been necessary and has been a useful instrument of the human race. The great square and clock and the bridges are to be considered among the most important problems of food and water. Problems are to be solved, where beautiful buildings are to be built, or the health of a community is to be preserved, there stands the Technology man—a leader.

William B. Rogers has done his work. He has run his race, he has fought his fight, and he has stepped out into the Infatude. To us who are treating the path he broke the world is looking for the courage, the perseverance, the vision which made him noble. We face a responsibility which we cannot evade, and which we must accept. If we are honest and if we can meet it, we can accept the vision, the vision which we have been told to the last moment, the vision of the future. "The first men in the world were slow burners, free from artificial flavoring, and does not bite the tongue."

Nearly a month has passed since the Delta Epsilon contest. This contest was much talked about by all the students of the School, especially to mining engineering students, for Wyoming is a mining country, and much of Dr. Thomas' work there has been in mining.
