THE man that don't build castles in the air don't build any with bricks, an' that no better air castle building material than VELVET.

MISS VIRGINIA TANNER TO

COACH BALLET FOR SHOW

First Rehersal for Show Dancers
To Be Held Saturday

Afternoon

Miss Virginia Tanner, who coached the ballet and individual dancing in last year's Show, has again been engaged by the Show management to take charge of the dancing. In this year's production, Miss Virginia Tanner has long been connected with dramas and individual dancing having been prominent in dramas during her college career at Radcliffe, and directing numerous pageants since receiving her degree. Among the pageants of which she has had charge are the Greek Pageants at Baltimore, and at Worcester, the Masque of Rockport, and the Pageants of the Macdonald Valley, Maine. In this production, Miss Tanner has devoted much of her time to individual dancing, such as at the Titanic Memorial Pageant given at the home of Mrs. John Hays Hammond in Gledstone, and the overdoor Festival at George Gordon King's estate, in Newport, where she was one of the principal performers; and was for a time a dance instructor for the Boston Transcript. She has also returned from the European continent, and will start working on the Show ballet and chorus dancing immediately.

The first ballet rehearsal for the Show will be held under the supervision of Miss Tanner in the Union Room A and B, on Saturday afternoon at 5:00 o'clock.

E. E. SOCIETY

Illustrated Lecture on Electro-Magnets

Mr. C. H. Underhill, Chief Electrical Engineer of the Acme Wire Company, lectured before the Electrical Engineering Society, February 21st, on the subject of "Electro-Magnets." The talk was necessarily technical to some extent, yet it was delivered so thoroughly, thoroughly and experiment as to make it very

interesting.

Mr. Underhill first made a brief distinction between the two main types of electro-magnets, the portable and the tractor types. The first type is used for lifting and purposes where it is not necessary for the machinery to move. The second type is far more generally used, and comes in all the different forms of elec-

nclides. Mr. Underhill had in him a very extensive practical and theoreti-

cal knowledge of different methods and constructions upon the pushing power of the solenoid. Two special circuits had to be run into the Union in or-

order to enable Mr. Underhill to carry on his experiments.
