- **REMAIN AT INSTITUTE**

  (Continued from page 1)

- **Course in Practice Big Advance.**

  The course in Engineering Practice is a great step forward in education. It is the first voice of cooperation which the student can hear and which the work has proved to be vitally necessary. The essence of this new venture is education depends entirely on the principles of modern education. The student should be allowed to make the best of the information which he is able to.

  "The demand for technically trained engineers is growing greater every day. The emphasis of science and technology has been moved to a new level of understanding. I say in it, in its research. I say it to you, in its research. On the persuasion of this spirit that he can be, as the best possible for his country's service."

  "The Chemist as a Citizen."

  "Chemists as a class hold a much higher position in the estimation of the general public that they did three years ago. This is due in the fact that the chemist has come out of his shop and has taken a more active part in present day problems. The great problem today in chemical is whether democracy is a matter of democracy or is a matter of individual achievement. Take for instance the dye-off industry of Germany which is organized into a great unit, an industry in which all the factors are under a central control and in which the all plant secrecy is not necessary. Such a condition could not exist in this country. Democracy tends toward individualism, but in this individualism proceeds initiative and self reliance. It is, therefore, very difficult to work out a new system which will preserve the inherent American traits and will incorporate the strength of German efficiency and centralized control." Prof. Walker commented briefly on the theory and practice of the chemist's contribution to its country.

- **Conferences.**
