ANTI-MOSQUITO DRIVE

(Continued from page 3)

which the plans of the campaign and the facts of the mosquito menace were distributed, by a series of prominent speakers. To aid this campaign in its successful operation, the Colorado State Council by a unani- mous vote, appointed Mr. S. W. Hill and Mr. W. E. Wright, representatives of the Colorado Agricultural College, and Mr. T. C. E. Paget, representative of the University of Colorado, to act as public speakers on the subject of the extermination of mosquitoes.

The successful operation of this campaign is to be carried out in every town, according to plans presented. The importance of mosquito control will be stressed, and the necessity of preventing the breeding of these insects will be emphasized. In the case of permanent bodies of water, such as ponds or canals, the water should be taken to assure that no breeding takes place.

In cities, the breeding of mosquitoes can be prevented by the proper drainage of the water bodies. This can be accomplished by the use of oil or kerosene on the surface of the water or by the use of tooth powder or similar substances. Water bodies should be drained at the end of the season to prevent the breeding of mosquitoes.
