AMERICAN AVIATORS BEING TRAINED IN THE USE OF GAS-MASKS AT TECHNOLOGY

The war is brought more closely home to us when we see the men performing the gas-mask drill. The gas-mask is one of the most essential of all defensive war products, produced under the demand of the Allies and the United States, through the agents of the Allies and the United States, through the steamer carrying 50,000 tons of raw material to the United States. The assembly line is a maze of activity, with units moving along at a steady pace, all working to the same goal.

Soon, soldiers will be able to put on these masks in an instant, at any time, to protect themselves from gas attacks. The masks are being manufactured in factories across the country, with thousands of workers putting in long hours to complete the task.

In the meantime, the Allies continue to push forward, using all available resources to defeat their enemy. The war is far from over, but the Allies are determined to see it through to the end.
