**ELECTRICALS HOLD SMOKER**

(Continued from page 1)

One very interesting feature of the generating plant itself is the con-

nection with this system. As we have already mentioned, the company is equipped in the

office of the local dispatcher, and the completion of control which he has

seen the running of service. What

the interpretation of service for any

length of time means to the manufac-

turing concern of Boston may well be

ruled when the size of the Gillette

machine is considered. This con-

cern, turning over seven blades at the

rate of two thousand a minute, would

suit six thousand if current were

shot off for more than several seconds,

for such an interruption in the electri-

cal balancing and preparing systems

terribly rains every single which is being

tested at the time. Other examples of

firms seriously affected by the loss

of electric power are the paper mills,

glass blower, and iron and steel found-

ries. When these cases are not

considered, it must be evident that the

eminent importance of the total dis-

connection, the company has been the

running fees of service of the concern's public

To enable as complete a control over

service satisfied not only means the

development of such a system of power

generating and controlling system as the local dispatcher's

connection, but it also means the con-

sistent operation and preparation for the operation of an enormous number of

electricity, for both alternating and direct current production. A good

example of this is the storage battery bank, with which the direct current

automobiles are provided, capable of carrying the complete di-

on the road for a period of one

with every transformer and ro-

auto-electric work of the station.
