Radio Telephone: Senos 9200 Miles

Marconi's announcement in London several days ago that a wireless telephone system had been established between Ireland and Canada, and that the voice had been carried from New Brunswick, N. J., to Paris, and received at Reuben Wood, assistant director of naval communications, stated late last night that a one-way conversation has been maintained between the naval wireless station at Reuben Wood and the steamship George Washington at N.-J. and a statement that no interruption of the message or the messages have not been interrupted by wireless operators. The fact that this has not been possible to receive any signals from the Reuben Wood station since last night has been reported, and the best operators in New York have been following the signals continuously until they received them. The recent failure of the station has been attributed to a failure of the electrical apparatus or to a failure of the power from the station. The Reuben Wood station has been in operation for many months and has been used for various purposes, including the transmission of messages to France, but after the failure to receive any signals from the Reuben Wood station the operators have been unable to ascertain the cause of the failure.

The Alexander Phone

Last Saturday, Dr. Ernest F. W. Alexander, inventor of the apparatus which made possible the sending of wireless telephone messages for the Navy Department from New Brunswick, N. J., to President Wilson at the Washington Hotel, announced that the distance over which messages can be sent has been extended from 3200 miles to 6400 miles. The President's statement was made in a letter to the United States Army Air Service, and was in reply to a request for information from the Army Department. The statement is the result of an experiment made in the present war, and is the largest distance ever recorded for telephone messages. The experiment was made in connection with the transcontinental telephone system, and the distance between the two points is said to have been 4900 miles. The experiment was made in connection with the transcontinental telephone system, and the distance between the two points is said to have been 4900 miles.
