PYRALIN

-the material of a thousand uses

PYRALIN is a product of organic chemistry—technically known as phenyl phthalate—made from cotton seeds, and used and later treated with various chemicals, coloring materials, and stabilizing agents.

PYRALIN is made and sold in the form of sheets, rods and tubes in a wide variety of sizes. A complete selection of color shades and inhibitive color effects such as ivory, yellow, red, orange, and pearl is available.

PYRALIN finds an ever increasing use in hundreds of varied industries for fabricating a wide assortment of finished articles varying from tiny novelties to window lights for automobiles.

PYRALIN has many desirable qualities which adapt it for many uses. It is colorless, non-toxic, non-salted, not affected by moisture, corrosion, or by heat of any kind. It is not affected by acids, alkalis, or by any other chemicals. It can be cut, sawed, turned, drilled, blown, pressed, stamped, rolled, polished, blown, turned, and given the desired shape.

PYRALIN is exceedingly durable and practically unbreakable with ordinary usage. It does not rust, tarnish, corrode, or is easily kept clean. It is plastic when heated and can be fashioned into any shape desired.

Each such new发现 has its own unique uses, but perhaps the most significant of these is the discovery of PYRALIN as a material for the construction of window lights for automobiles.
