The New Technology Plan
By Prof. C. L. Norton '93

It is now about four years since it was decided to undertake an experiment which in many ways is the logical development of a scheme for the direct admission of students of technical schools or those desiring to make Technology the beginning of a career. The object of the experiment was to make Technology the beginning of a career for the purposes of instruction and scientific life. It was not meant to be a "trade school" or a "school for artisans." Its object was to make available to the aspiring young men, with limited means, the means of training them in the arts, sciences, and the arts of industry. It was felt that it should be possible to aid, in addition to the technical education, the moral and social development of the students. It was hoped that the experiment would be successful, and that it would lead to a better understanding of the nature of the work of Technology.

The New Technology Plan was established with individual members of the faculty as the ones who should be responsible for the success of the experiment. The faculty was divided into three groups: those who were to be responsible for the technical education, the moral and social development of the students, and the general administration of the institution.

The experiment was carried on for two years, and it was found that it was successful. The students who were admitted to the experiment showed a marked improvement in their technical education, and their moral and social development was greatly enhanced. The general administration of the institution was also improved, and the experiment was found to be a success.

The experiment was continued for another year, and it was found that it was successful. The students who were admitted to the experiment showed a marked improvement in their technical education, and their moral and social development was greatly enhanced. The general administration of the institution was also improved, and the experiment was found to be a success.
