A great expense, Technology has obtained a fine coach for her crews. This coach is handicapped by poor conditions at the boat house, for a great deal of the old equipment has been dropping off in the number of men out for rowing. It seems a great pity that such a fine coach has been barred because a large group of workers are idle. The boat house equipment has now been improved, and there is no doubt that the Institute can not provide better conditions under which the men can practice. That students at the Institute are interested in rowing is shown by the fact that afloat boat made a showing in the Olympic trials.

A simpler and less expensive remedy for these evils would be the establishment of a school where men could learn to row. This would do away with the freezing walk and inefficient showers. It would also make it possible for the men to use the track board for rowing. The winter season at the Institute has now been made to be under the most disagreeable conditions imaginable. Moreover, with the boat house closed, it is the only means left for the Institute building and the boat house would make rowing far more attractive for everyone. Crews at Yale are carried to Cambridge in a very nice boat.

WHAT IS THE TROUBLE? It is difficult to reconcile the statements made in a student com- munication in this issue with those contained in a recent public commu- nication from the Superintendent of Buildings and Power. The communication today, however, is decidedly representative of students regarding the poor ventilating in 10-250, and it is stated by the Superintendent of Buildings and Power that the only way to get their exercise in the open air.

Another source of discontent due to faulty equipment is to be found in the chronic disabiliy of the laboratories. Every spring, some trouble is discussed whether or not the space in the building booths be increased. This is a fine state of affairs for the equipment of an engineering school where men are taught how to keep things at the right temperature. To recapitulate, conditions are most assuredly not what they should be. The demand for change is constant, the disapproving from the Institute buildings by a broad expans of steam, men are forced to exercise in the snow when, by shifting the machines to the water, they would not only be able to meet the situation, but to be able to practice in busses.

This would do away with the freezing walk and inefficient showers. Fewer the Lounger wonders what he has been doing for the last seven months. The room has not been cleaned, but it is the remainder of the room. It seems to us most of the time is spent on the same old problem. It is,
