Much Power Yet Undeveloped in Lakes Vicinity

Work in Great Lakes Region Shows Much Unused Power

Government engineers have recently completed a power survey of the Great Lakes Region and the amount of power that might be utilized by the use of submerged turbines is great, according to the results of the survey. The water power in the Great Lakes is great, and the availability in the east is determined by the size of the power stations of the country.

Among the industries such as tanning, food preserving, and dairying, the water power is still undeveloped power stations. The capacity of water power plants is over 225,000 horsepower in 25 States. The work of the survey is not yet complete, but it is anticipated that the amount of power could be used with benefit in the country.

In addition to the regular water power stations, there are also very small water power plants. These water power plants are not yet utilized because of the high cost of building power stations. The work of the survey is not yet complete, but it is anticipated that the amount of power could be used with benefit in the country.

The survey was completed last spring, and the results are now being analyzed. The work of the survey is not yet complete, but it is anticipated that the amount of power could be used with benefit in the country.
