FIELD DAY

ONE OF the great foods at Technology is more undergraduate spirit. Whoever called the Institute a "factory" was right in other ways. In the majority of cases the students are so intent on their work that they have little time for social relations or athletics. There are, however, a few students who manage to combine the two.

As a result of these things the average man graduates from the Institute with a certain amount of social experience. So, when he comes to a new environment, he is able to make friends easily.

The clinic of the Medical Department, which is organized to care for the first symptoms of illness, is also doing its part. The students are benefited from the experience of a doctor and from the efficiency of the clinic's staff.

Burdens and Troubles

Although the main emphasis is placed on the present, the future must also be considered. The student must be prepared for the next step in his education.

MEDICAL CARE

A STRANGER looking at Tech students would say that apparently they are a healthy group of men, and in this opinion he would be correct. However, the medical staff of the campus should realize that among the people there are sure to be a few sick, who are not putting their best foot forward.

The clinic of the Medical Department, which is organized to care for the first symptoms of illness, is also doing its part. The students are benefited from the experience of a doctor and from the efficiency of the clinic's staff.

The worst of these conditions are overwork, late hours, and the lack of rest and recreation.

The greatest success of the Medical Department has been in its efforts to prevent illness. By treating the students early, the time of injury can be saved and lives can be preserved.

However, medical care is not the only aspect of the hospital that is important. The hospital is also responsible for the well-being of the patient as well as his physical health.

New College Test Seeks More Accurate Grading

The new type of examination in which instead of answering questions that the teacher can give him, he must write his own answers, the same as if he were writing a letter, to someone he has never seen before, has come to be known as the "open" examination.

Professor Wood, who is director of the Achievement Test Research Department, has been experimenting in his search of a better method of measuring human ability. He has come to the conclusion that by requiring the student to write an essay in which he must answer questions in the form of a letter, he can measure the student's ability in a way that is more accurate than any other method.

The test is given to a group of students, and the results are tabulated. The teacher then reads the essay and determines the student's grade.

The test is one of the most difficult that students have to take, but it is well worth the effort. It is a way of measuring human ability that is more accurate than any other method available.

It is a difficult test, but it is a necessary evil if we are to measure human ability accurately. The test is not easy, but it is necessary if we are to have a better understanding of human ability.
