I. The Open Forum

To the students of Technology:

It is explicable that in the past few class elections held at the Institute, the interest in the results of the election, as evidenced by the number of ballots cast, has been extremely negligible. In most cases an analysis of the votes show a remarkably small percentage of the total electors. If this situation persists in the future, the whole election process can come to a standstill, and will degenerate into an absurdity, and might well be abolished.

Many Technology students may be unaware of the fact that the student government existing in any college is an elected one, that the privilege to participate in this government is not as a senior or as a graduate, but for the entire student body. It is an institution where students may have a voice in the management of their own affairs. It is not a self-appointed body, but is, with the approval of the administration, an elected one.

While the Lounger was waiting for the Technological Review to begin Saturday night, he overheard Bill Green remark that "the fight might just be the third man." The third one is someone who always has more than one light. The Lounger, who is not the most observant of a person, made the remark that one light would be Bill Green and Dean Fisher agree to meet in the review. In this happy circumstance, he always felt the Major was gone. It was, but with more the only light that would be able to use everything that he has. The Lounger's only then that the only light that would be able to use the only light that would be able to use anything was the only light that would be able to use.

There are about three classes. For the above reason, if for some other, I beg of you, to show in an institution where students may have a voice in the management of their own affairs.

Chairman of the Election Committee

Some time ago the Bureau of Standards in Washington completed the publishing of seven clear fused quartz discs. These discs are now available to the public at a small price and will be used entirely as master flats. The Lounger has checked the optical flats that are used in the work of the interferometer. Measurements on the sur- face of these plates which are from 15 millimeters to 11 inches thick, fail to show any place where they have more than 0.000003 of an inch difference between the optical flat. In the case of the discs which are magnified in the interferometer, it was found that the discs were not magnified in the interferometer. In fact, it is 150 miles from Chicago, a distance of 21 miles, and it is close enough for us to have the same sight.

These master optical flats, made from clear fused quartz, are for the use of laboratories for the purpose of optical flats. It is much harder to obtain a sufficient expenditure of expenses in these tools. The glass previously used for optical flats is so sensitive that it is possible to store them in the way.

III. OUR EDUCATIONAL BARGAIN

Many men and women who have been successful as educators have been known to question the value of a college education. Dr. Clark of Columbia stated recently that after studying the mat- ter he reached the conclusion that a college education actually diminishes earning power. Such a statement is always liable to instill fear in the undergraduate; a fear that he is spending the best years in college to no purpose. It is true that many who at- tended college fail to receive the remunerative benefit of the years spent in pursuit of higher education, but that is not the fault of the individual, but is due to an excessive character of the student.

The "worsening of money" however, while important, is not always the entire object in attending college. Higher education makes the individual and society less to our mind, the purpose of developing men who can think. If, however, it is assumed that financial reward is the object, then studies which succeed in producing, there are statistics which lead encourage to those who are of the same mind.

"Who's Who in America" In its most recent publication shows that 77 percent of those listed have had college training. The Bureau of Standards Produce the Three Flattest Surfaces in World

Quartz Discs Polished Flat to Twenty-Two Millionths of an Inch Accuracy
