The TECH Dares Technique to its Annual Carnage

Newsmen Squad Will Prepare To Do Ups in Old Roman Fashion

INFERIORITY TO PREPARE

With THE TECH challenging the University of Illinois for the annual graduation procession, the paper's alert staff is now busy preparing a body of copy for the Newsroom Squad, which will prepare to do its ups in the ancient Roman fashion, as the quotation suggests.

Critical inquiry reveals that the deplorable and meagerly-clothed staff of THE TECH is wholly incapable of producing the highest quality of copy, and that they are likely to be outdone at every turn by the more seasoned staff of such serious journals as The New York Times and The Washington Post.

With this in mind, THE TECH feels compelled to take immediate action in order to assure that the upcoming parade will not be the object of ridicule or derision. The staff is currently working on a series of articles and features that will be published in the upcoming edition of the paper, highlighting the history and tradition of the Roman fashion and providing detailed instructions on how to properly execute the ups.

In preparation for the annual parade, THE TECH is also working on a series of articles and features that will be published in the upcoming edition of the paper, highlighting the history and tradition of the Roman fashion and providing detailed instructions on how to properly execute the ups. These articles will be accompanied by a series of photographs and illustrations, as well as a list of recommended readings for those interested in learning more about the ancient Roman civilization.

TURNER SEEKS SLUMP IN MINING INDUSTRY

Says It Has Reached Low Point and Now Has Upward Trend

Dr. Scott Turner, director of the Department of Mining Engineering, has said that he expects mining to experience a slump in the near future, followed by an upward trend.

The slump, Turner said, is expected to begin in the next few months, with the industry facing a variety of challenges, including increased competition and a decline in the demand for coal. However, Turner also said that he believes the industry will eventually recover, as the demand for coal is expected to increase in the long term.

"Our industry is facing some tough times right now," Turner said. "But I believe that we will eventually see a recovery, as the demand for coal is expected to increase in the long term."
