FLOODS AND GOVERNMENT MONEY

For two weeks the entire eastern part of the United States was deluged with water, the most devastating floods in the history of the country, judged on the basis of property losses and on the entire scale of the disaster, made only by the Galveston flood of 1900 and the Johnstown flood of 1889, the greatest flood of all lives, but in the first instance, it was due to the dam break, and in the second instance, to a tidal wave.

The Berkshire, Adirondacks and Alleghenies were covered with a deep layer of snow during the winter months, and the saturated snowbasin was transformed into water. The plateau borders, due to the dam break, and in the second instance, to a tidal wave.
