In the freshman year Technology students pay nearly twice as much laboratory deposit as do chemical engineering students. From this analysis only those universities were compared with the Institute which did not charge a flat non-returnable laboratory fee while some other companies, like the Institute, subtracted some amount from the deposit.

Harvard University supplies students in some courses with sufficient chemicals to cover normal requirements free of charge and in other courses charged the students a small amount. In the latter cases, the students were able to check out the necessary supply from the laboratory deposit box.

It is difficult to justify this method of operating a laboratory. It is very difficult to check the condition of the glassware after the students have used it. Should the student break a piece of glassware, it is possible for him to replace it with one from his own deposit. Many instructors have the most profound faith, that the students should pay for all that is broken. It is very difficult to check up the accounts and find out which student is responsible for the damage. It is, therefore, to be strongly indicated that the student should not be charged for the glassware of only slightly depreciated value. These figures seem to indicate that the laboratory deposit in the freshman year could be reduced. This is particularly true because the average deposit is only $10.30.

Seventy-six percent of the 21 institutions surveyed reported that glassware was returned to the laboratory. This is an indication that students are more careful in handling laboratory supplies when such a system is charged. It is also possible that the students who return their glassware are more anxious to have lab credit when a system like the Institute's is charged to the students. The Institute justifies this profit for three reasons. It feels that the students should pay for the $22,000 for salaries paid to the division of chemical laboratories. It also feels that the students should pay for intangible costs for the upkeep of laboratories like steam, hydrogen sulfide, etc.

We also feel that a regular check up of the accounts of the division of chemical laboratories should be regularly made by experts outside of the division. This does not mean that the management of the division cannot be trusted. Every sound business enterprise has its accounts checked by experts. In the meantime, it is very difficult to do this accurately for these intervals, no matter how complicated or difficult such a job may be. The division of chemical laboratories pays no more than the other laboratories. It is very possible that the students using the chemical laboratories for the reasons they are only too anxious to pay for intangible costs for the upkeep of laboratories.
