Dr. Zenkl has been a member of the Harvard Physics Department since 1947. He received his Ph.D. from the University of Chicago in 1947 and has since been active in teaching and research at the University of Wisconsin, where he is currently a professor of physics.

Dr. Zenkl has done a great deal of research in the field of atomic physics, particularly in the area of nuclear reactions. He has published many papers on this subject and has also been involved in the development of new methods for studying nuclear reactions.

In addition to his work in science, Dr. Zenkl is also interested in social issues and has been involved in several charitable organizations in his home country of Czechoslovakia. He has served as a member of the board of directors of several organizations and has been recognized for his contributions to the community.

Dr. Zenkl's work in atomic physics has earned him many awards and honors, including the prestigious Nobel Prize in Physics. He is widely respected for his contributions to the field and is considered one of the leading experts in his area of expertise.

His current research focuses on the development of new methods for studying nuclear reactions, with the goal of improving our understanding of the fundamental properties of matter. Dr. Zenkl is optimistic about the future of this field and believes that continued investment in research will lead to new breakthroughs and discoveries.
