The news must be given to the student government. The real problem is one of student government and the government's relationship with Incomm.

Incomm in Action

As if to back up their demand for delegation of responsibility, the Advisory Councils set up by Incomm early in the fall have been particularly busy this past week. The Committee on Comprehensive and Oral Drama has made a strong appeal for having well-reasoned callings put into the undergraduate curriculum. The Comprehensive Rating Committee has been investigating the possibility of lodging controlling students over-night in Walter-Henderson. The Junior Class Nominating Council Board is now having glass covers glued over the bulletin boards.

Among other forthcoming activities, the Committee will sponsor a Christmas Convocation in Kings Auditorium on December 18th. In the future, a Parent's Weekend and a Toronto Theater Group will be offered by representatives of Incomm. The purpose of this activity, according to Incomm, is to refresh the students and to help the students establish a positive action. It is important for members of Incomm to realize that their position involves more than simply attending meetings; it requires outside work.

For the next meeting, Incomm has requested all members to submit short statements on the subject, "What Does Incomm Institute Exist?" Furthermore, all interested MIT students have been requested to submit any written suggestions they may have to their Incomm representatives. Any one not contacted who would like to contribute may speak at the TCA Committee meeting. All solicitations will be distributed to various living groups, and the highest team will receive a tin of beer.

The money will be distributed among all the various charities, with each student having a chance to give a proportion to their group. The idea is that Incomm's actuarial representatives will be simultaneously determined.

With the Russian drive for technical superiority, it is completely necessary to change the educational system of our nation. We must not only add to our accomplishments in science and technology, but also in the humanities and the arts. In order to retain our competitive edge, we must continue to improve our educational system. The Russian competition has forced us to continually strive for excellence.

The United States, too, is facing a challenge to maintain its position as a global superpower. We must work together as a nation and as individuals to ensure our continued success.

This year marks 50 years since Sputnik's launch, and it is clear that we have not been complacent. The United States faces a significant advantage in the race for technological innovation, but we must not take our success for granted.

In conclusion, the United States must continue to push the boundaries of science and technology. We cannot afford to be complacent, and we must be prepared to face the challenges that lie ahead. Our success in this endeavor will determine the future of our nation.
