near the Holy Cross Cathedral

Another Unmatched Engineering Facility to Advance Propulsion Systems of the Future

Future aircraft and missiles may require propulsion systems different from those in wide use today—different in size, power output, appearance, and perhaps even in the basic method of utilizing energy.
To probe the propulsion future...and to build and test greatly advanced propulsion systems for coming generations of flight vehicles, Pratt & Whitney Aircraft is now operating its new Florida Research and Development Center. This facility supplements Pratt & Whitney's main research and development installations in Connecticut.
The new Florida Center, financed and built by Pratt & Whitney Aircraft, is unique in America's air industry. Here is a completely air-conditioned plant with 17 acres under roof specially designed and equipped for the development of new power plants of virtually any type. Testing is handled in special isolation areas; the nearest is four miles from the plant and many miles from any inhabited area. The new Center can be greatly expanded on its 10-square-mile site. Continued isolation is insured by a vast wildlife sanctuary in which the Center is located.
Of the many people employed at the Center today, about half are scientists, engineers and highly trained technicians. By late next year, the total number of employees is expected to be almost doubled.
The new Florida Research and Development Center is one more reason why Pratt & Whitney Aircraft is able to continue producing the world's best aircraft propulsion systems . . . in whatever form they take.
