Influenza Shots Now Being Given

By Medical Dept.

Free influenza shots for the students were begun for the benefit of the MIT Medical Department. The MIT health insurance policy will pay for the shots at 100% per person. Shots are available at the Medical Clinic in the basement of the Chemical Laboratory.

For Students Only:

At the present time, there is a sufficient amount of vaccine on hand to make available from the influenza firms to all students where MIT community. It has, therefore, been decided that vaccine will be available for students only and supplies are more plentiful," said Dr. D. Clark, director of the MIT Medical Department.

Shots will be given on a first-come, first-served basis. Persons who have never had an influenza shot and who had flu within the last six weeks are excluded. Those who have never had the shot need only one shot.

Shots are already present in Boston, and is possible to have an epidemic during the winter months, continued Clark.

Dr. Albert Seeler, Medical IG, said there is a distinct possibility of an influenza epidemic in the fall and winter. Influenza rates and the number of cases of flu should rise when the fall begins. The last regular epidemic of influenza in Massachusetts came in the fall of 1948.

Those who do not care or cannot get influenza shots need not unduly concern themselves. The vaccine is far from being effective.

Furthermore, about 35% of the vaccinations do not get a reaction.

The chairmen of “Cold and Flu Aware” were: Joseph Blakeslee, sophomore, and George Newell, freshman.
