Quarter system among proposals (Continued from Page 1) 

A group of professors at MIT, in an effort to make the quarter system more flexible and effective, has proposed a new system that would allow students to choose from a wide variety of courses and programs. The proposed system would allow students to select courses and programs based on their interests and career goals, and would provide them with more opportunities for self-discovery and exploration. The new system would also include a more flexible grading system, which would allow students to receive credit for courses they have completed, even if they have not earned an A or better. This would make it easier for students to complete their coursework and progress more quickly through their degree programs. The proposed system would also include a more rigorous examination process, which would help ensure that students are truly mastering the material they are studying. Overall, the new system would provide students with more choices and opportunities, and would help them to better prepare for their future careers.
