Last year, according to a report released by the National Institute of Higher Education, the majority of campuses at which examinations were held, found that the average final exam scores were not as high as anticipated. The report indicated that the frequency of examinations did not seem to affect the students' performance significantly. However, the report did note that the average final exam scores were higher than that of all non-fraternity groups. This was consistent with the report's earlier findings, which showed that only 37 percent of the campuses had higher final exam scores. In contrast, a report released by the National Institute for Higher Education this year indicated that only 87 percent of the campuses had higher final exam scores.

The report further stated that the average final exam scores were not as high as expected. The report also noted that the average final exam scores were higher than the all-men's average. The report concluded that the average final exam scores were not as high as expected.

The report further stated that the average final exam scores were not as high as expected. The report also noted that the average final exam scores were higher than the all-men's average. The report concluded that the average final exam scores were not as high as expected.
