The Mitchell Trio, left to right Mike Kubiak, Chad Mitchell, and Joe Frazier, will make their first MIT appearance Tuesday, November 24 at 8:00 at Kresge Auditorium. Better known as the Chad Mitchell Trio, this group has been on the college circuit for several years singing folk songs and satires. Their version of "The John Birch Society" raised storms of protest and their neo-Nazi number has been banned on TV. Tickets on sale yesterday in the lobby of Building 10. They are $1.00. An activities or staff card is required for purchase.

Due to the popularity of the group, expectations are high. It is estimated that all tickets will be sold the first day. LSC expects all tickets to be sold the first day.

Mitchell Trio to perform

Clinical Research Center seeks protein requirements, effects of beryllium, understanding of brain functions

PhD, a fundamental scientist, is under study at the clinic by Dr. Harriet Hardy of the Medical Department. Beryllium disease is typical of a wide range of industrial illnesses, and methods of its control are widely applicable.

Dr. Hardy, who has done much of the original work in this field, is studying the mechanism of beryllium poisoning. Believing calcium to be an important factor in the progression of this illness, she is studying the effects of controlling calcium in the diet.

With over thirty people on the clinic's staff, the psychology department is finding it possible to study patients requiring special medical attention. As part of a continuing project, Dr. Juan-Lukas Fedner, the department chairman, and his colleague, Dr. Thomas Twitchell, are working with patients suffering various head injuries.

As with past efforts, this work tries to advance the understanding of brain functions by analyses of the ways in which sensation or movement are changed in the presence of various brain lesions. Malfunction is assessed by quantitative methods, including special EEG techniques such as computer averaging of brain potentials.

Recovery of functions is also under study, particularly in cases where social depression has exaggerated the impairment that results from early damage to the brain.

Final responsibility for the clinical aspects of these projects is held by Dr. Albert O. Squires, director of the MIT Medical Department.

Local medical supervision of the center is exercised by Dr. Lillian Barklow who serves in the double capacity of assistant professor and medical supervisor. She has previously done basic and clinical research at the Peter Bent Brigham Hospital and at the Harvard Medical School.
