Auto panel includes Morse

Continuously increasing air pollution has prompted the Commerce Department to name a sixteen-man panel to investigate the potential of electric automobiles. Heading the group will be Dr. Richard R. Morse of MIT's Sloan School of Management. The panel will also include experts in the fields of transportation, economics, and air pollution.

The panel is to complete its report within nine to twelve months. Its specific assignments include: 1) a survey of the current state of electric automobile development; 2) an estimate of the feasibility of building practical electric automobiles; 3) a comparison of electric motors with other types in terms of performance and pollution; and 4) a recommendation as to the government's proper role in developing electric vehicles.

Faculty committee to review SCEP reading period poll

(Continued from Page 4)

for one semester only. After that, a final decision will be reached about whether the extension was worthwhile. Thus, SCEP will take a poll this week to evaluate the effectiveness of the past reading period. A similar poll will be taken at the end of this semester, when the extension will be in effect, and the results will be compared. These results will be shown to the Faculty Committee on Academic Performance as part of their report at the end of this semester, and the committee will recommend to the SCEP committee whether the extension be continued or not.

SCEP reading period poll

(Continued from Page 4)

that they may assess the general usefulness of the reading period. So please fill out and return the completed poll as soon as you receive it.

What kind of engineer will you be... preliminary design, design, development?

At AiResearch Phoenix, you work as all three before you decide.

Your future as an engineer is strongly influenced by your first assignment. What that assignment will be, should be, is an important decision.

At Garrett you control that decision. During an eight-month orientation program, you work with experienced engineers on a variety of assignments in different areas. Your permanent assignment depends on your aptitude and interest.

In preliminary design you may work on gas turbine engines, jet engine starters, or advanced power systems for space vehicles. Analysis is the key—and the emphasis is on thermodynamics, fluids, vibration, heat transfer, and math to solve today's problems.

As a design engineer, you see your solution to a product design problem take shape on the drawing board and in fabrication. You may work on controls systems for turbine drives, engine fuel systems, or a laboratory test system. Mechanics is the theme—statics and dynamics, materials and processes, and graphics are your tools.

In development, you'll test designs before they go into production. Manufacturing processes are examined and production techniques are explored. Everything from nuts and bolts to complete power systems are tested, and your lab work and practical judgment will pay off in this area.

Your career at AiResearch Phoenix can be stimulating and rewarding. You can work in all three important areas of engineering on diverse aerospace products. You may gain your total education, learn more on top of it, and take part in a wide variety of advanced engineering.

At AiResearch Phoenix, the product lines include gas turbines for auxiliary power, turboprop engines for business and military aircraft, secondary power equipment for aircraft, advanced space vehicle nuclear power systems, pneumatic and hydraulic control systems, as well as a variety of related equipment for aerospace, ground, and underwater applications.

Find out the whole story in our new booklet, Your Future at Garrett. Get it from your campus placement office, or write AiResearch Manufacturing Division, 402 South 36th Street, Phoenix, Arizona 85034.
