Letters to The Tech

To the Editor:

The significance of the table presented at last week's Tech also demonstrates how incorrect conclusions may be drawn from the data presented.

The data presented by the speaker at the table was obtained from a survey conducted by the MIT Student Center. The survey was administered to a sample of MIT students, and the results were analyzed to determine the percentage of students who support various campus policies.

The table presented at last week's Tech showed that 70% of students surveyed supported the proposal to increase funding for student activities. However, when the data was analyzed more closely, it became clear that the percentage of students who support this proposal is not as high as the speaker claimed.

In fact, the data presented at last week's Tech showed that only 60% of students surveyed actually support the proposal to increase funding for student activities. The remaining 40% of students surveyed either oppose the proposal or have no opinion on the matter.

Moreover, it is important to note that the survey was conducted during a time of significant campus unrest, which may have influenced the results.

It is clear from the data presented at last week's Tech that the proposal to increase funding for student activities is not as widely supported as the speaker claimed. It is important for the administration to carefully consider the evidence presented at last week's Tech before making any decisions about campus policies.

Sincerely,

[Name]

P.S. It is important to note that the survey was conducted during a time of significant campus unrest, which may have influenced the results.

The Tech
