WPI charts bold reforms

(Continued from page I-A) have some features in common with more traditional "cook-up" arrangements, with a much closer association with the school and an individual faculty member. There will be more emphasis on group work, since modern engineering is rarely done by one person working in isolation.

It is hoped that two features of the study project plan will help to remedy the current absence of the humanities from engineering education. First, each student must do one of his two projects in an area of "humanistic technology" which may involve political considerations or environmental engineering. Secondly, it is expected that, through the close association with faculty members, the students will see that individual members of the faculty are interested in the humanities.

Calendar change

WPI's calendar will be changed to better accommodate the study projects. There will be two 7-week terms before Christmas, a long intercession, two 7-week terms after Christmas, and "hopefully," a summer session. Courses will be seven weeks long, more intensive than at present, and the normal load will be three per term.

Lecture format

Many courses will be taught in a format of lectures and "lecture conferences." White said. For a number of subjects, the lecture conferences will be grouped according to student interest. For example, students interested primarily in electrical engineering, physics, and mechanical engineering may attend the same physics lecture while being grouped in different conference sections.

BSU sit-in terminates party at Faculty Club

(Continued from page I-A) The black lawyer, arrived at MIT Sunday night, spent that evening meeting with the BSU, then filled his day yesterday meeting with various people -- workers, management officials, etc. -- within the community. Assistant Provost Paul Gray described him as a "professional in the business of conflict resolution," he may serve only as an arbitrator in the wage dispute, or he may recommend more far-reaching changes.

Union complaint

In a related development, the Union has filed an "unfair labor practices" charge with the state Labor Relations Board. Their petition holds the MIT Faculty Club, Incorporated, responsible for the interception of other parties in the contract negotiations between the union bargainers and the Club management.

Why doesn't General Electric sell new ideas to the cities instead of new gadgets to the suburbs?

After thirty years or more of neglect, there's no question our cities need help.

But what kind of help?

Will another thousand sanitation men be the answer to dirty streets?

Do doubling the police force or another thousand sanitation men will help to enforce crime under control?

Can renent laws force landlords to provide more low-income housing?

All the old, obvious ideas have been tried. What's needed are new ideas and new technological developments.

General Electric has been working on the problems of cities for a number of years now. And in that time we've come up with some things we think will help.

- Garbage

General Electric research has come up with what is probably the most revolutionary idea in garbage disposal in years. Our scientists are working on a process by which a special strain of bacteria converts garbage into a high-protein food for cattle.

The process is still something of a "laboratory trick," but it could be in the pilot-plant stage in as little as three years.

Crime

You might not expect a company like General Electric to be doing anything about crime.

But the fact is, GE has been working with the Syracuse police, looking for a new approach to the problem. Our scientists there came up with a whole new concept in police organization called "Crime Control Teams."

In their first year, these teams were credited with cutting crime 62% in one large, representative neighborhood of Syracuse. And the concept has since been adopted by a number of other cities.

Housing

To meet the critical need for new low-income housing, General Electric is participating in the Department of Housing and Urban Development's Operation Breakthrough.

While GE has no intention of going into commercial home building, we do hope to supply the builder-developer with new products needed to improve his efficiency.

We now have several design prototypes of advanced, modular homes that can be assembled in a matter of hours.

These are just a few of the new ideas General Electric has come up with to help cities at the same time that we continue to improve

"gadgets" to help people.

We don't think our home products are at all unnecessary or frivolous. If they seem that way, it's because people have forgotten how much they rely on them. To wash dishes. To wash clothes. To keep cool. To entertain.

And on and on.

New ideas for the cities and new "gadgets" for the home both have the same end in mind, after all. To help people live better.

Why are we running this ad?

We're running this ad, and others like it, to tell you the things General Electric is doing to solve the problems of man and his environment today.

The problems concern us because they concern you. We're a business and you are potential customers and employees.

But there's another, more important reason. These problems will affect the future of this country and this planet. We have a stake in that future. As businessmen. And, simply, as people.

We invite your comments. Please write to General Electric, 570 Lexington Ave., New York, N.Y. 10022.
