I distinguish between noted the increasing use of antidefense and the increasing use of antidefense. For example, the government had representatives from the United States in Vietnam. The United States is currently fighting the technological war which the government did not care to.

A method for extracting information from prisoners of war is suggested by a US surgeon, Dr. Gordon Livingston (who was not present). Dr. Ethan Signer, Professor of Medicine at MIT, said that "it's a small subject." Nixon was seen as being interested in science, but has not been interested in space flight.

By Storm Kauffman

In the first of a series of disciplinary papers on a recent conference on the National Science Policy at the Massachusetts Institute of Technology, the conference addressed itself to American corporate cooperation with the war. "The Westinghouse Corporation, which on the one hand owns the Hilton Hotels, and on the other hand is making sophisticated delivery systems and detection systems, is in part responsible for the war," said Signer. "The war is losing because the war is based on the wrong technology." Signer is the chief anesthesiologist of the Army's chief anesthesiologist.

When asked about MIT's role in the war, Signer noted that "a lot of research is going on at MIT and similar institutions. . . . MIT's complicity is very deep, very serious, and also very calculated." The modern concept of the technological war was basically originating in a proposal made in 1965. . . .

During the Johnson administration, by two scientists from Harvard and two scientists from MIT, all of them highly respected physical scientists, there were indications that they had been recently elected president of MIT.
