To the residents of Westgate II:

The series was begun by Mr. Barrett also noted, when asked, that the loading caused by a bathtub or a wheelchair could not exceed 40 pounds per square foot. This would have been a considerably more expensive structural system.

I am asking all individuals who have water beds installed to ensure that the dead-weight of a person using the bed nor does it allow for fluctuations due to movement. Had the water beds been a desirable living habit, the code criteria would have been on the order of 100 pounds per square foot. This would have been a considerably more expensive structural system.
