By Glenn Brownstein
Sectionally-ranked Middlebury dealt the MIT soccer team its second loss of the season at Middlebury Saturday afternoon, 1-0.

The Panthers, fifth-ranked in New England, relied on a good passing attack and ball control offense to defeat MIT. Their resulting offensive advantage caused them to outshoot the Tech eleven, 21 to 7.

The Engineers, obviously tired from the long trip, played a flat first half, as their passes failed to click and they lacked overall aggressiveness.

The defense played well enough to hold Middlebury scoreless, though, for the Panthers were unable to mount any kind of offense after an sharp first fifteen minutes.

With two minutes gone in the second half, Middlebury's leading scorer, wing Charlie Jackson, booted one just beyond the reach of goalie Ritchie Staff.

This goal awakened MIT's soccer weary, and they began to play the tough, aggressive, stop-passing game that had previously led to two wins and a tie in their first four contests.

Unfortunately, Middlebury was left to the challenge and stopped the MIT attack in addition to providing some offensive punch of their own, as Staff had to make ten saves in the second half to the Middlebury goalie's one.

Although the statistics would seem to indicate that Middlebury dominated the game, MIT played the Panthers fairly evenly until the last ten minutes, which was played almost entirely in MIT's half of the field.

MIT's next game will be Wednesday at Brandeis in their Greater Boston League opener, followed by a game Saturday afternoon at Lowell Tech.

The End of Objectivity
Lecturer: Dr. Gail-Carl Baer, Professor of Applied Mathematics and Natural Philosophy, M.I.T.
Respondent: Dr. Victor F. Weiskopf, Instructor in Physics, M.I.T.

Wednesday, October 17: 5-7 P.M., Lecture Hall 9-150

Monday, October 21: 5-7 P.M., Lecture Hall 9-150

INTERACTIVE LECTURES

COSMOLOGY
HEAT AND SPIN IN THE UNIVERSE
by Prof. Philip Morrison, MIT

IMPLICATIONS OF THE APOLLO 11 LUNAR MATERIAL
by Dr. John A. Wood, Smithsonian Observatory

SYNTHETIC THEORY OF THE ORIGIN OF HIGHER CELLS
by Prof. Philip Morrison, Boston University

EXPERIMENTS ON THE ORIGIN OF LIFE
CHANCES FOR EXTRATERRESTRIAL INTELLIGENCE
by Prof. Carl Sagan, Cornell

LEAF INSECTS, BIRDS, AND HUMAN COLOR VISION
A VIEW ON THE FUNCTION OF A NEURON
by Prof. Jerome Letton, MIT

CONTINENTAL DRIFT AND PLATE TECTONICS
by Prof. Raymond Siver, Harvard University

Students and others who are curious about the topics above are invited to use an experimental system containing these interactive lectures, which were recorded specifically for individual listening. The lectures are unique in that they include a great many recorded answers to interesting questions. The answers extend and deepen the discussion, and can be quickly and conveniently accessed.

If you would like to try the system, please call 694-4600, ext. 2800, or write a short note to Karen Houston, Polaroid, 730 Main St., Cambridge, mentioning when you might be free and how you can be reached.
