The Cambridge YMCA may be used next fall to house MIT students until completion of the new West Campus dorm, scheduled for October 1.

Students to be housed at 'Y'?

The Cambridge YMCA may be used next fall to house MIT students until completion of the new West Campus dorm, scheduled for October 1.

Wheatley said that not all of these options will be used, but that construction of the dorm continues on schedule. However, if the new dorm is not ready to house the 150 students scheduled to move in October 1, MIT will have to find housing for all 300 students.

Overcrowding in existing dorms will be "just what we had this year," said Wheatley, unless new dorm students are moved into them temporarily. MIT will have space for 1100 students next fall, but will have a freshman class of 1130 to 1150 students, "assuming the Admissions Office comes in on target," she noted.

The Cambridge YMCA, located in Central Square, has "a very good setup," Wheatley said, describing the rooms as "singles with beds and desks, comparable to MIT rooms."

Fifty students could be housed in one building of Random Hall. While this might disrupt the operation of the building, which is normally used for dormitory use, Wheatley explained that "we want the students to be grouped together.

MIT humanities: what role?

One engineering faculty member called the MIT administration "for setting policy without adequately consulting." This sets a very important precedent. The students which MIT is negotiating to buy—seven or eight reactors, each producing 1000 megawatts of electrical energy—will produce a total of 2000 megawatts annu.ually. Officers of the Energy Research and Development Administration told The Tech. Iran is a signatory to the 1970 Non-Proliferation Treaty, pledging the Iranian government to specific provisions against building nuclear reactors. Under that treaty, Iran could be allowed to process spent fuel under international supervision. The United States, however, can specify in the sales agreement that the fuel be processed outside of Iran, as was specified in nuclear reactor sales to Egypt and Israel.

Reaction

Educational problems with the proposed nuclear engineering training program have drawn criticism from many members of the MIT faculty. Faculty members have called the program "academic prostitution" and "selling a child to the devil."
