Crowding brings more income

By Mark James

This year, the dormitory system is more overcrowded than it ever has been. This crowding had been planned by the MIT administration since last winter.

The Institute is faced with an endowment that has not grown to keep pace with inflation at the time that its expenses are soaring.

Their motivation is money. The Institute is faced with an endowment that has not grown to keep pace with inflation at the time that its expenses are soaring. The administration has taken two major steps in order to counteract the trend; cutting expenditures and attempting to increase income and gifts.

The primary means of increasing income has been to increase tuition revenue by about the number of undergraduates.

In 1975 severe crowding was planned, but a drop in the admissions yield—the percentage of students who accept MIT's offer of admission—resulted in a smaller class and less overcrowding.

MIT's ability to increase class size is limited not only by the lack of dormitory space presently available but also by the enormous difficulty that the Institute has had in financing new housing construction. New House has not yet been paid for by contributions, and the administration has delayed plans for any further construction until it has financed what it has already completed.

Apparently, donors would rather give money for a laboratory than a dormitory...

The class size set by the academic council is only a target; the actual size of the incoming freshman class has diverged widely from their target. In 1974, 1975, and 1977, the class size has exceeded expectations. In the first two of those three years the error resulted in increased crowding; this year Random Hall was opened to absorb the excess.
