Michael A. Isnardi G
Computers will advance in three separate areas in the next two decades, Isnardi predicted. There will be a more natural interface between humans and computers as well as more flexible intermachine communication, he continued.

"Computers which can synthesize and execute entire programs given their English language equivalent," will be invented, he said, and rapid advancement in integrated circuits will enable large amounts of data to be stored in a small space.

Society will be greatly affected by the changes in the next twenty years, Isnardi said. The growth of technology could put strain on society by causing unemployment, he said. Isnardi forecast the "final coming of age of electronic mail, banking, and shopping," and an era when computer users will allow people to work in their homes.
