James Watt looked thoughtfully at the Newcomen engine and saw that it was inefficient, expensive, and slow as a mule in mud. He figured out how to improve it, and the Industrial Revolution came to pass.

We could use people like that.

The reason we lead the world in things like aircraft engines, elevators, and air conditioning, is that we're never really satisfied. We keep improving things. Even new things like spacesuits and weapons control systems.

We're looking for people who never think anything's perfect. People with your kind of Class-A education, plus a mind that can make a brilliant leap of imagination and then buckle down to the nuts and bolts.

In return, we're offering the worldwide companies of United Technologies. Companies where 12,000 engineers, right up to top management, speak your language.

The first step's easy. Stop by the campus placement office, or write for more information and a reprint of this ad. United Technologies, P.O. Box 1379, Hartford, CT 06143.
