Paul E. Tsongas, the former Democratic Massachusetts senator who died Dec. 1, had been treated for cancerous growth in his abdomen before he died of radiation and chemotherapy.

Tsongas, 51, had described himself as a former “big-celled lymphoma,” has not been spread to other parts of his body, Tsongas said. His doctors at the Dana-Farber Cancer Institute here said they had "a total response," and said he would release his entire medical history as an example.

The cancerous growth in his abdomen, which he described as a “large-cell lymphoma,” has not spread to other parts of his body, Tsongas said. His doctors at the Dana-Farber Cancer Institute here said they had "a total response," and said he would release his entire medical history as an example.
