MOSCOW

Russia's nuclear arsenal survived intact for three decades of Cold War. But last week, it was under threat. After a NATO exercise in the area, the country's military command said it had been a target of a missile attack on their headquarters.

A statement from the base said "the military preparedness of the Strategic Rocket Forces was not impaired." But the country's security establishment was not to be taken lightly. On Friday, the United States called the exercise "disconcerting." The exercise was a response to recent diplomatic tensions between the two countries.

The command post was reportedly struck by 17 warheads, each carrying 1,000 kilotons of high explosive. The exercise was seen as a test of NATO's capability to launch a nuclear attack on Russia.

In the wake of the exercise, the Russian government announced it would scale back its nuclear arsenal by 30%. The move was seen as a response to the declining threat from the United States and its allies.

The exercise was part of the U.S.-led Cobra Gold military exercise, which involves multiple nations. The exercise was seen as a way to test the interoperability of NATO's forces.

The exercise was also seen as a test of NATO's ability to launch a nuclear attack on Russia. The exercise involved multiple nuclear warheads, each carrying 1,000 kilotons of high explosive. The exercise was seen as a test of NATO's capability to launch a nuclear attack on Russia.
